

STATUS OF CLAIMS

1. (Currently Amended) A process for reconciling actual data with estimated data within a workflow process for a project ordered by a buyer and performed by a seller, the method comprising:

- obtaining the estimated data from any source relating to the project;
- receiving the actual data from the seller via a communication network;
- comparing the actual data to the estimated data to determine any discrepancy between the actual data and the estimated data; and
- notifying the [[buyer]] seller of any discrepancy, wherein upon notice of the any discrepancy the [[buyer]] seller can account for any discrepancy.

2. (Previously Presented) A process for reconciling as described in claim 1, wherein the actual data comprises an actual cost, in whole or in part, of either goods or services, or goods and services provided by the seller in performance of the project.

3. (Previously Presented) A process for reconciling as described in claim 1, wherein the actual data comprises an actual accounting, in whole or in part, of either goods or services, or goods and services provided by the seller in performance of the project.

4. (Previously Presented) A process for reconciling as described in claim 1, wherein the actual data comprises at least one measurement of at least one parameter defining at least one aspect of the project.

5-14. (Canceled).

15. (Previously Presented) A process for reconciling as described in claim 1, wherein the workflow process generates at least one request for either at least one good or at least one service, or at least one good and at least one service to be provided by the seller to the buyer for the project, wherein the project is defined in terms of at least one parameter, and wherein the system converts the at least one parameter into the at least one request, and wherein the system communicates the at least one request to the seller.

16-21. (Canceled).

22. (Previously Presented) A workflow system for reconciling actual data compiled for a project by a seller with estimated data for the project, the project ordered by a buyer and performed by the seller, the workflow system comprising:

- a first interface for interacting with at least one buyer;
- a second interface for interacting with at least one seller;
- a memory for storing the estimated data and the actual data, wherein the actual data is received from the seller database via the second interface; and
- a processor controlling the memory, the first interface and the second interface, wherein the processor compares the actual data to the estimated data to determine any discrepancy between the actual data and the estimated data, and wherein the processor notifies the buyer via the first interface of the any discrepancy.

23. (Previously Presented) A workflow system for reconciling as described in claim 22, wherein the actual data comprises an actual cost, in whole or in part, of either goods or services, or goods and services provided by the seller in performance of the project.

24. (Previously Presented) A workflow system for reconciling as described in claim 22, wherein the actual data comprises an actual quantity, in whole or in part, of either goods or services, or goods and services provided by the seller in performance of the project.

25. (Previously Presented) A workflow system for reconciling as described in claim 22, wherein the actual data comprises at least one measurement of at least one parameter defining at least one aspect of the project.

26-33. (Canceled).

34. (Previously Presented) A workflow system for reconciling as described in claim 22, wherein the workflow system further comprises a system for implementing a process to generate at least one request for either at least one good or at least one service, or at least one good and at least one service to be provided by the seller to the buyer for the project, wherein the project is defined in terms of at least one parameter, and wherein the system converts the at least one parameter into the at least one request, and wherein the system communicates the at least one request to the seller.

35-50. (Canceled).

51. (Previously Presented) A process in a workflow system for comparing at least one first response to at least one second response, the at least one first response and at least one second response being responsive to at least one request by a buyer for either at least one good or at least one service, or at least one good and at least one service for a project, the process comprising:

receiving the at least one first response at the workflow system via a communication network;

receiving the at least one second response at the workflow system via the communication network;

comparing the at least one first response to the at least one second response; and

presenting the comparison to the buyer through an interface with a buyer system via the communication network.

52-53. (Canceled)

54. (Previously Presented) A process in a workflow system for comparing as described in claim 51, wherein the first response is provided by a first seller through an interface with a first seller system via the communication network, and the at least one second response is provided by at least one second seller through an interface with at least one second seller system via the communication network.

55-63. (Canceled).

64. (Previously Presented) A workflow system for comparing an at least one first response to at least one second response, the at least one first response and at least one second response being responsive to at least one request by a buyer for either at least one good or at least one service, or at least one good and at least one service for a project, the workflow system comprising:

a buyer interface;

a seller interface for receiving the at least one first response and the at least one second

response from a seller;
a memory for storing the at least one first response and the at least one second response; and
a processor connected to a buyer interface, a seller interface, and the memory, wherein the processor compares the at least one first response to the at least one second response, and wherein the processor presents the comparison to the buyer via the buyer interface.

65. (Previously Presented) A workflow system for comparing as described in claim 64, wherein the first response is provided by a first seller through a first incidence of the at least one seller interface, and the at least one second response is provided by at least one second seller through a second incidence of the at least one seller interface.

66-130. (Canceled).
